

■ Presentation Guide: AI Customer Support Platform

Here is a simple, natural-sounding script you can use to explain your project. It's written exactly how you would speak to an audience!

1. The Introduction (The Problem & Solution)

"Hi everyone! Today I'm excited to show you the AI Customer Support Platform we built."

- **The Problem:** "We all know how frustrating it is to contact customer support. You usually have to wait hours, or even days, for a reply. On the other side, the human agents are completely overwhelmed answering the same basic questions over and over."
- **Our Solution:** "To fix this, we built a smart, real-time ticketing platform. It uses an AI Agent to instantly answer customer questions. If the problem is too complex, the AI automatically hands the ticket over to a human agent. But we didn't stop there—we also gave the human agents an 'AI Copilot' to help them do their jobs 10x faster."

2. The Demo (Walking them through the app)

Step 1: The Login Page

- "First, let's look at the login page. We designed this to look like a premium, modern SaaS application. It uses a highly secure authentication system behind the scenes so that only authorized Customers, Agents, and Admins can access their specific dashboards."

Step 2: The Customer Side

- "Let's log in as a Customer. If I create a new ticket asking for help, you'll see it looks just like a modern chat app. As soon as I send a message, the AI evaluates it and replies to me instantly. I don't have to wait in a queue."

Step 3: The Agent Side (The Magic)

- "Now, let's log in as a Support Agent and look at that same ticket. Here is where the real magic happens. The agent has an **AI Copilot Sidebar** that acts as their personal assistant."
- "If there is a massive chat history with 50 messages, the agent doesn't have to read it all. The AI generates a 3-bullet-point summary in one click."
- "The AI also scans the chat to tell the agent if the customer is feeling Happy, Neutral, or Frustrated."
- "Finally, the AI writes polite, perfect reply suggestions. The agent can just click one to send it, saving tons of typing time."

3. What Makes This Special? (The Tech Stack)

"If you're wondering how we made this so fast and smart, we used three special technologies:"

1. Live Chat Technology (WebSockets)

- "Instead of making the user refresh the page to see new messages, we used WebSockets. This creates a permanent, open connection between the user and the server. When someone types a message, it appears on the other person's screen in milliseconds."

2. The AI Brain (Google Gemini)

- "For the AI, we used Google's Gemini API. It's incredibly fast, which is why our platform can generate summaries, detect customer emotions, and write replies with almost zero delay."

3. The Smart Memory (ChromaDB)

- "The biggest problem with AI is that it sometimes makes things up. To prevent this, we used a special vector database called ChromaDB. We upload the company's actual rulebooks and policies into it. When a customer asks a question, ChromaDB instantly grabs the correct rule and feeds it to the AI. This means the AI only gives 100% accurate, company-approved answers."

4. The Conclusion

"To wrap up..."

- "We haven't just built a simple ticketing system. By combining live WebSockets with Google's AI and a smart database, we've created a platform that makes customers happier, drastically reduces waiting times, and gives support agents superpowers. Thank you!"
